

Fieldbus / Modbus / Interbus

Fieldbus / Modbus / Interbus: general

A bus system enables the UPS system to be connected to the building services management system, OPC (OLE for Process Control) and RCP (Remote Control Panel). This can be achieved either by a Fieldbus, Modbus or Interbus. All required UPS system data can be transmitted via a bus system to automation systems, such as building services management, OPC and RCP, for example. Data buffering enables different bus speeds to be used. Each UPS system can appear as a separate bus subscriber and be monitored and controlled as such.

Features

- Use of standard interfaces and protocols
- Communication via RS 232 and RS 485
- Can be used with one or more systems
- Local transmission capability
- Enables telemonitoring
